

Crescentic Osteotomy Blades

NGD offers a selection of saw blades in 3mm increments giving the surgeon more options to choose the optimal cut for the patient's tibia.

- The variety of blades enable the surgeon to choose the smallest radius possible for a patient's tibia to facilitate the preservation of more bone behind the tibial crest and to reduce the amount of rotation required to get the desired correction.
- The saw blades are 50% thinner than conventional blades. NGD blades combine a thinner blade with finer teeth designed to cut bone efficiently and effortlessly.
- Size range includes 15mm, 18mm, 21mm, 24mm, 27mm and 30mm.
- A convenient re-sharpening service includes the use of loaner blades.

Crescentic Osteotomy Plates
